Java Challenge "Github Resumé"

Thank you for accepting the challenge! Please find below the description of the task:

- Please implement a spring boot application that lets users build a github resumé similiar to http://resume.github.io/

- Create a landing page where the user can enter his or her github account

- Implement a "generate button" on the landing page that starts processing the previously entered account name and redirects the user to the result page (the generated resumé)

- The result page shows a summary showing which programming languages the github account owner has used in his/her repository. That is sufficient. Feel free to add more statistics or to aggregate more data if you wish to.

- Create a REST API that produces JSON Data and that connects that data to the given HTML / Javascript template.

- Make sure to use the github API, please don't start parsing web pages manually

Please create a bitbucket.org/ repository for the task. Open it for jan.schuetze@exozet.com (Technical Director of Exozet) and jan.czapla@exozet.com (Senior Software Developer) so the colleagues can have a look at it.

If you have any questions please feel free to contact us!

Good luck and many thanks in advance!
